## 1. Introduction

There are many food applications that exist in the world: food delivery applications, restaurant ordering, and more. Many of them follow the traditional way of designing the application in an outdated design language, and many of them don't have a minimalist design and are user-friendly. Since then, the spark of an idea to design a food ordering application that embraces user-friendliness, minimalistic and intuitive design that allows the user to focus on more of what matters, instead of trying to figure out how to use it.

Introducing EatX, an application that is designed for restaurants to replace traditional menus and bring technology into customer services. No need to wait for a waitress to come to you in order to order your food. No need to be pushed by a waitress when you are taking a long time to figure out what to order. With EatX, you can order your meal at peace.

## 2. EatX functionalities

Main features:

### a. Food list

EatX's main functionalities present the user with a list of food offered by the restaurant. Unlike the traditional menu, the user can scroll through the menu dynamically to view without the need of flipping between pages.

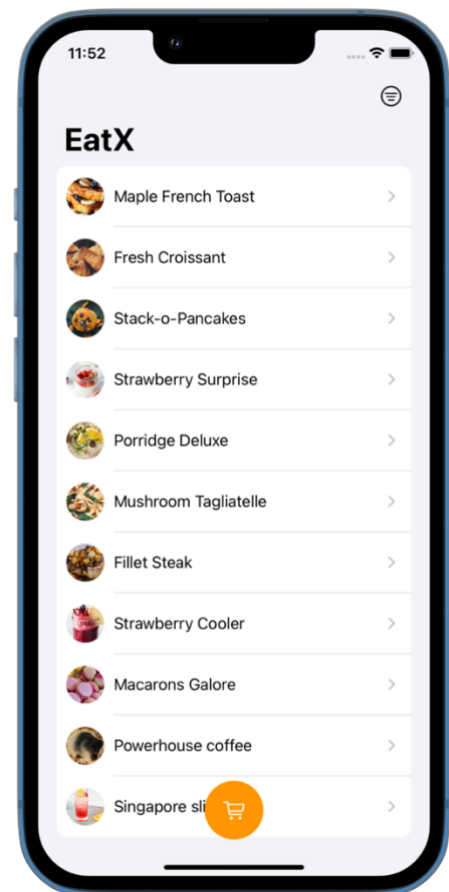

Figure 1: EatX home screen

## b. Food details

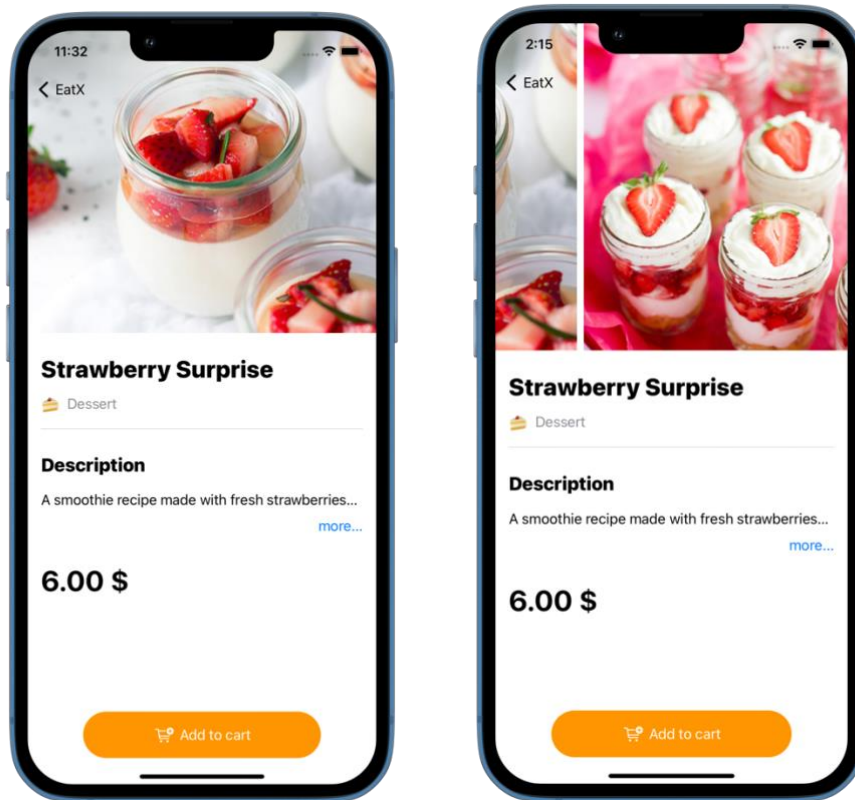

Figure 2: Food content view

When selecting a dish from the list, a detailed view of the selected food will slide in providing the user with all of the information about the food such as a brief description of what the food will look likes, the price as well as some food picture and food types.

The design of this view here is aimed to shift the focus of the user with a big beautiful visual of what the food will look like and users can scroll horizontally to view more pictures.

Extra functionalities:

### a. Tap to expand

Figure 3: Tap to expand function

Adding the ability to hide unnecessary information is one way to clean up the user interface. When needed to read the full text, the user is prompted with a “more...” button with the functionality to unwrap the text, expanding to its full length.

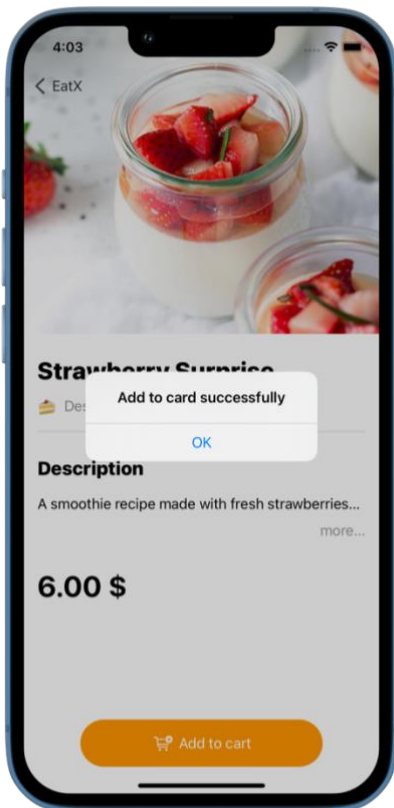

## **b. Add to cart**

*Figure 4: Add to cart function*

The most important function is the capability to add the item to the cart. It enables the user to put the food into the cart in order to proceed to the next step.

The “Add to cart” button will be always present at the bottom of the screen whenever which iPhone or iPad you are on brings forth user friendliness without the need to search for the button if they are out of view.

After pressing the button “Add to cart”, the system will pop up with a notification to confirm with the user that their chosen item has been added to the cart.

*Figure 5: Notification of add to cart successfully*

### c. Search food list

Figure 6: Search function

One of the best abilities offers by the application is to be able to search for a specific food rather than the traditional menu that the user needs to read the whole menu in order to find their preferred food.

The search bar will be above the list and hidden by default. Users need to scroll above the list and pull it down one more time for the search bar to appear.

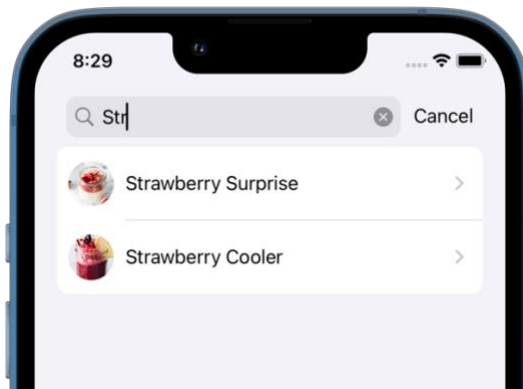

Figure 7: Search demonstration

### d. Filter food list

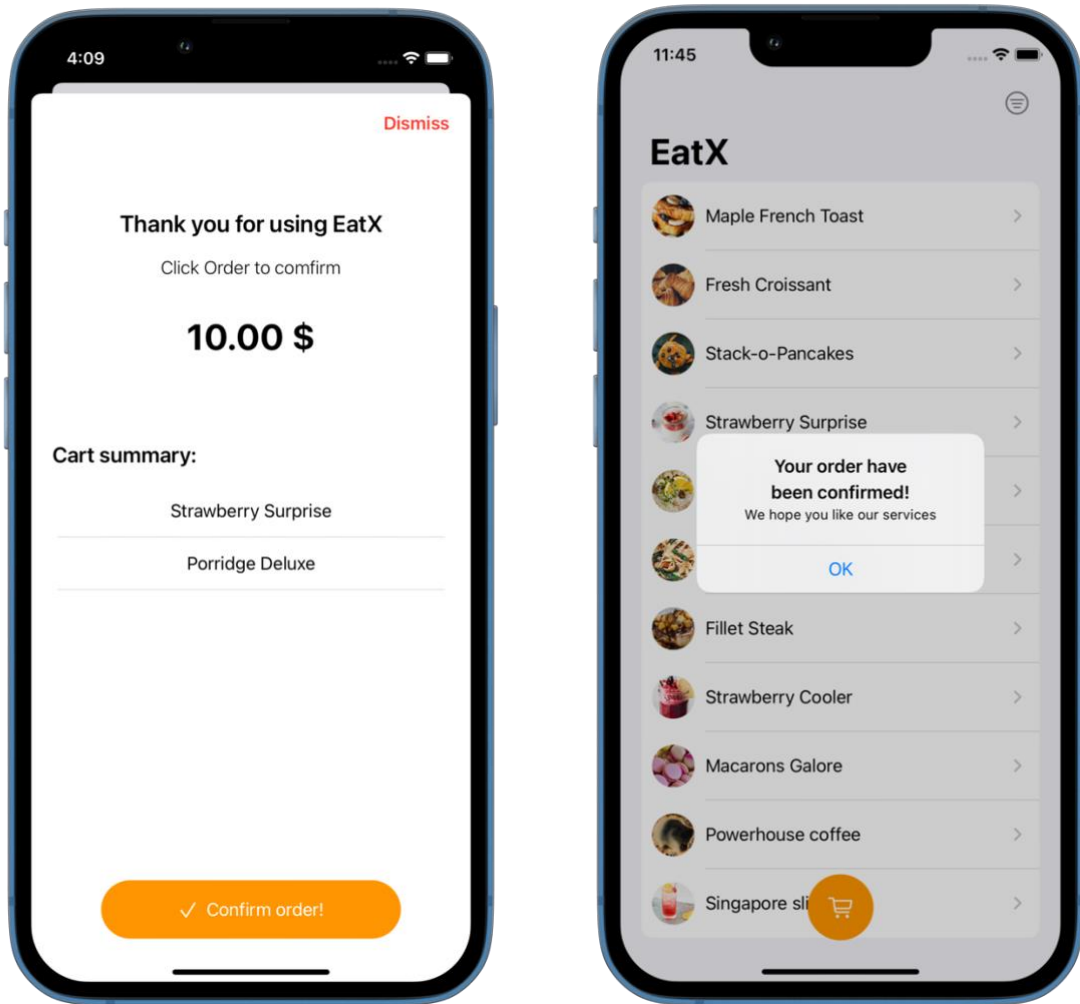

*Figure 8: Filter function*

To bring more convenience to the user experience. Users can now filter the list by the food type such as Breakfast, dessert, and more. By clicking on a type, the list will change dynamically and show only the result of the food-related to that type.

Moreover, users can use filters alongside with search to find a food with a specific type bringing more usability to the application.

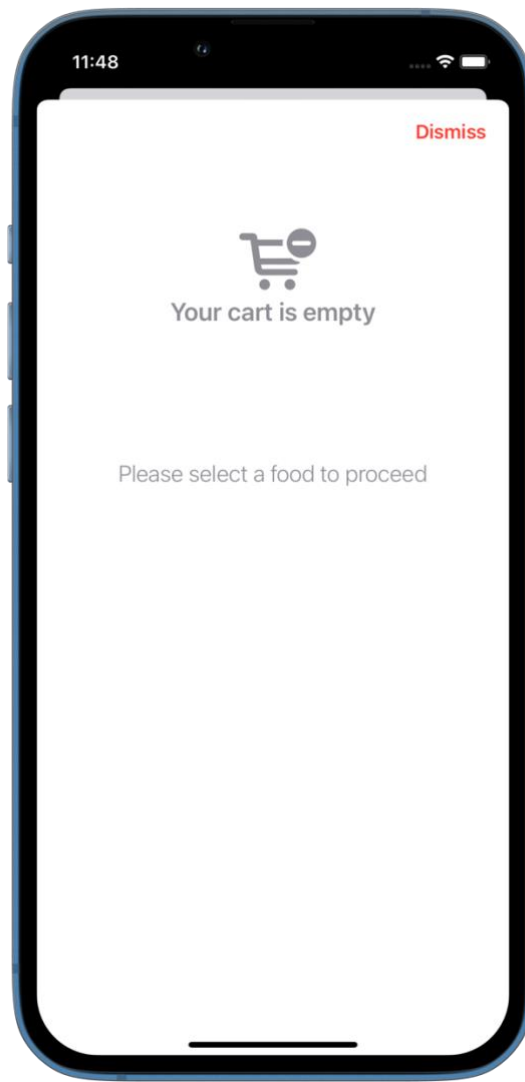

**e. Check out**

*Figure 9: Check out function with notification*

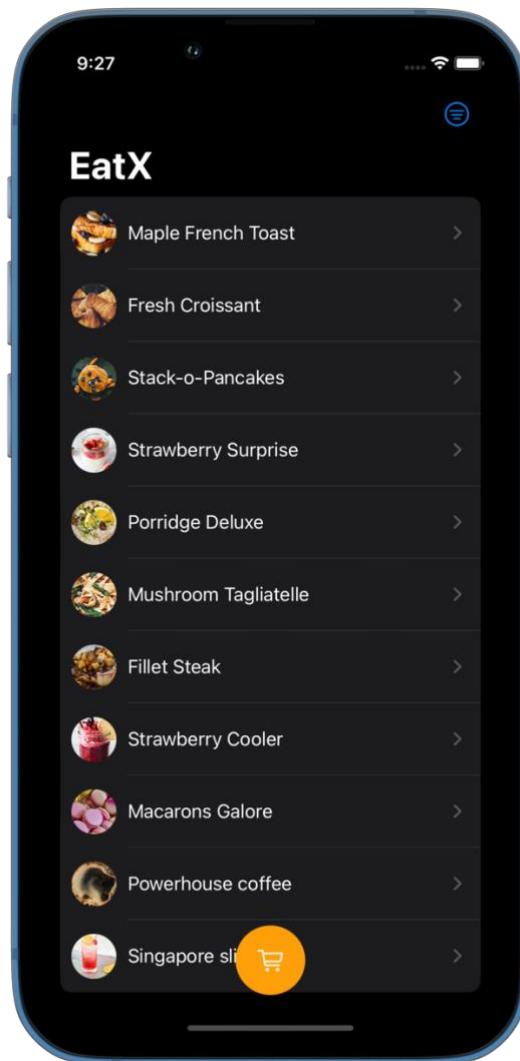

Extended with the add-to-card function, the application will present the user with a summary of their cart. While reviewing, if users want to add more items to the card, they can do so by swiping down to dismiss the pop-up view or clicking on the “dismiss” button. This function will temporarily close the popup view and not proceed to order the user food’s card. By only clicking on the “Confirm order!” button, the application will create an order and clear out the cart for the user.

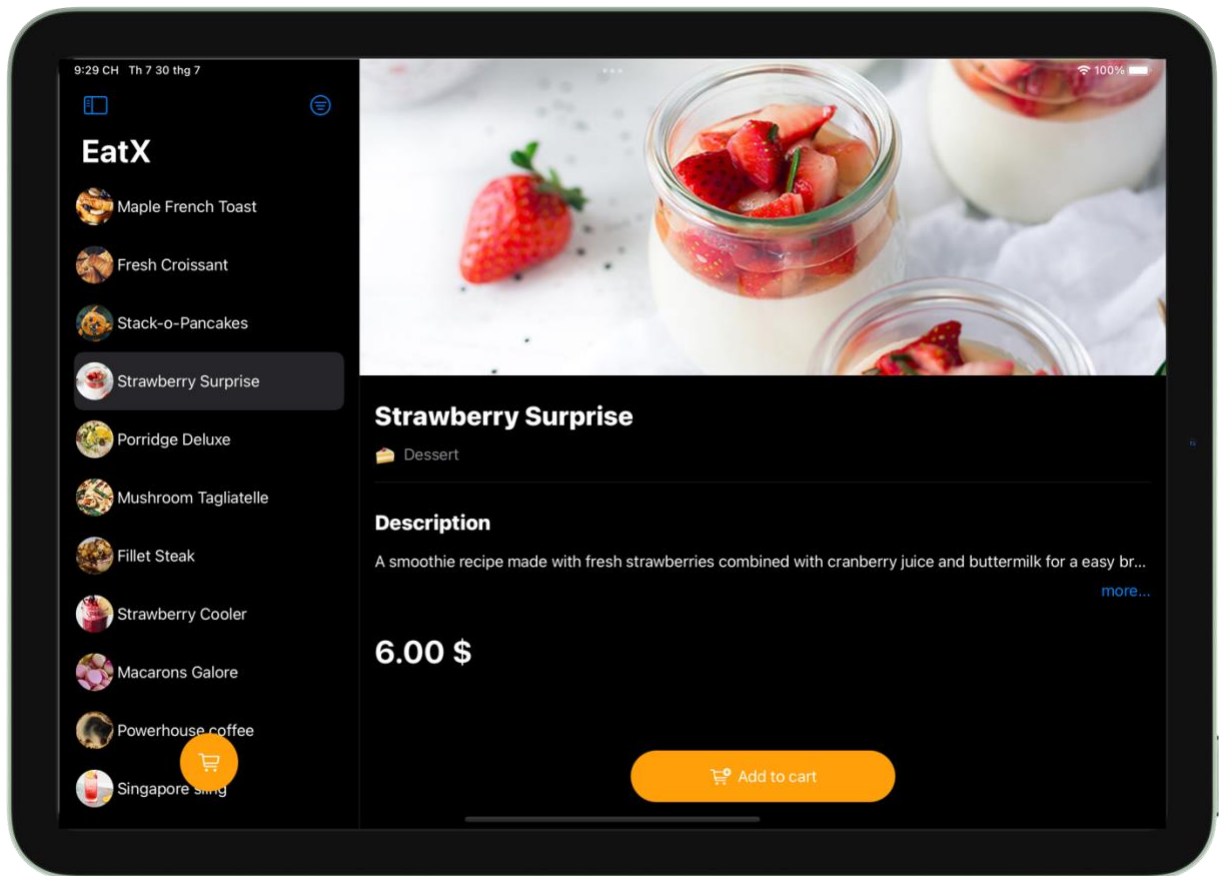

*Figure 10: Empty cart view*

This interface will check for the user cart. If there is no item in the user cart, the application will show this screen to the user prompting them with the information “Your cart is empty”.

**f. Support iOS, iPadOS dark mode**

EatX application have native support for apple Dark mode. User can switch between light and dark mode in iOS or iPadOS setting for this application to adapt to this change.

**g. iPhone, iPad, and iPod supported with iOS version 15.5 or newer**

- iPhone 8 or newer

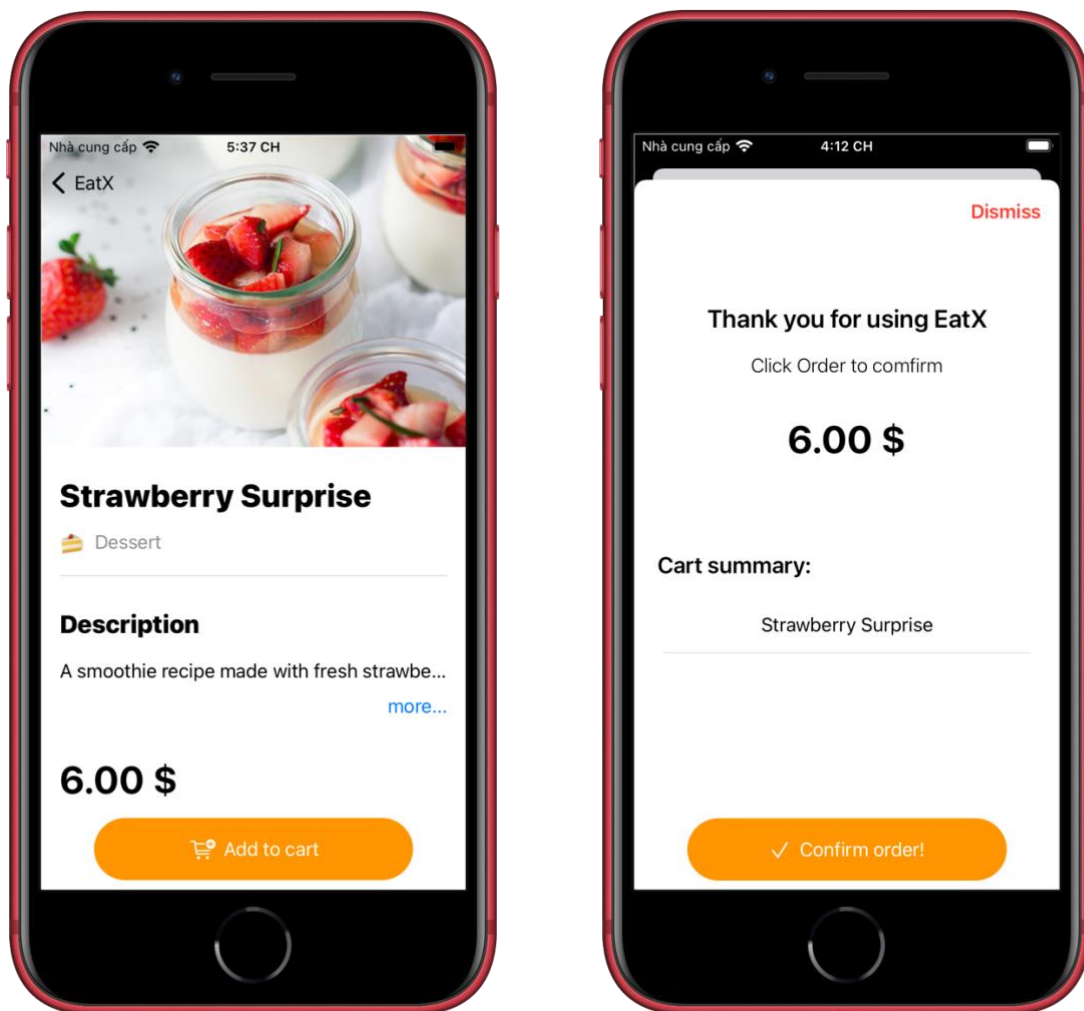

Figure 11: iPhone 8 EatX application

- iPad Air (5<sup>th</sup> generation), iPad Pro (5<sup>th</sup> generation), iPad mini (6<sup>th</sup> generation), iPad (9<sup>th</sup> generation) or newer

#### 4. Future development

Due to limited development time, many features will be pushed into the future development of the application. One of the main features that will be developed in the future is the ability to add the quantity of the. This means that there will be a counter asking how many amounts of the dish the user wishes to add to the card. Moreover, in addition to quantity, the cart summary will show the list of food by a group. Each food if they are in the cart as a single quantity will have the indication next to the name as “x1” and so on. This will create more friendliness towards the user end since the user does not need to manually calculate the total amount of the same dish.

Moreover, device orientation is limited to portrait for all iPhone models since when rotate horizontally, the screen height is small and with the current element position, the user can't read the information. In contrast, it does not apply to the iPad user given that they have more screens for more content. Support for portrait orientation for iPhone will be added in the future development of the application.

Additionally, a list view of the home page can be redesigned to have a more modern approach. Instead of a list view to display a list of food, it can be displayed as a card to embrace the visualization of the food instead of a small picture as in the current design. This follows the approach of the food detail view ensuring consistency throughout the application.

Lastly, the application can have a recommendation dish that is updated every day depending on the current season or availability of the food. This can be useful to the user that is new to that restaurant if they have never visited before or can help with making the decision in a customer respective.
